

Reverse Osmosis Systems

Reverse Osmosis is the process by which fresh water is removed from saline or salty water. Otherwise known as 'Desal Machines' in Australia, or 'Watermakers'.

Desalination and reverse osmosis units are available from Global Water Solutions. Global water has a broad range of products available, from small desal units right up to industrial sized machines for desal projects for mining and commercial industry.

Desalination in Australia is fast becoming the accepted alternative to fresh water supply. Desal is one of the best and most reliable ways to extract fresh water from the ocean or from bore water or spear water, that may contain a high concentration of salt. Combined with the correct pre-filtration system, desalination can be very reliable and completely safe for human consumption.

Reverse Osmosis systems are available in the following three sizes as standard:

ROLBW 3000

3000 Litres per day / 125 per hour

Recovery 15-20 %

ROLBW 6000

6000 Litres per day / 250 per hour

Recovery 20-25 %

ROLBW 12000

12000 Litres per day / 500 per day

Recovery 30-40 %
