

Cloudy water

The hot and cold water from our kitchen sink sometimes comes out very cloudy. If we leave the water in the container, it then clears up quickly and the cloudiness disappears. Should we be using this water, even after it turns clear?

Cloudy

water, also known as white water, is caused by air bubbles in the water. It usually happens when it is very cold outside and air gets mixed in with the water supply. It is completely harmless. The best thing to do is let it sit in an open container until the bubbles naturally disappear. Always check the smell and taste to be sure, before consuming large quantities of cloudy water, just to be sure it is only air bubbles that are present.
